

Finispeak

Project Overview & 4-Milestone Development Plan

Project	Finispeak - an on-demand marketplace for real-time human interpretation and language services
Project Price	\$2,000 total - four \$500 milestones
Primary Delivery	Web, iOS and Android platform for real-time human interpretation, plus a reusable commercial API.
Development Order	Core web platform, admin and API; real-time calls/transcripts/payments; education/business/API service; mobile apps, landing website and launch.

Project Overview

Think of Finispeak as an Uber for translators. Users can find an available verified human interpreter based on language, dialect/region, specialty and availability, then connect for real-time communication.

Finispeak is human-first. Interpreters can understand slang, regional expressions, dialects, tone, cultural references and conversational context that automated translation alone may miss. AI assists with transcription, summaries, language detection and matching without replacing the human interpreter.

Finispeak can start an interpreted call or use supported telephony workflows to bring an interpreter into an existing phone conversation as a third participant. The same reusable backend/API will support the web platform, native mobile apps and a commercial API for outside businesses and developers.

Market Opportunity & Differentiation

Finispeak combines capabilities often separated across traditional interpretation services and AI translation tools. Its human-first marketplace can match users by language, dialect/region, specialty, availability and reputation.

The platform combines **human interpretation + cultural context + intelligent technology + a consumer-friendly marketplace experience**. Users can choose verified interpreters, view profiles and ratings, save trusted interpreters and reconnect later, while AI supports live transcription, language detection, intelligent matching and summaries.

Core User Experience

New Finispeak Call

Find -> Pick Interpreter -> Call -> Interpreter Connects -> 3-Way Interpretation -> Transcript -> Follow Up

Already on an Active Phone Call

Open Finispeak -> Find/Pick Interpreter -> Add Interpreter -> 3-Way Interpretation -> Transcript -> Follow Up

User Experience & Trust

Keep the customer experience simple: choose the language, find an interpreter, review a concise verified profile, see pricing and connect. During a session, users see straightforward call controls and live transcripts; afterward they can access authorized transcripts or summaries, rate/review the interpreter, save favorites and reconnect with interpreters they trust.

Smarter Matching

Matching can consider interpreter specialty - such as medical, legal, business or education needs - while automatic language detection can help identify the language and route users toward the most appropriate available interpreter.

Four Development Milestones

Milestone 1 - Core Web Platform, Accounts, Admin, API & Accessibility

\$500

- Functional authenticated FiniSpeak web application and dashboard.
- Firebase Authentication and Cloud Firestore account/data structure.
- Interpreter onboarding and profile management: personal information, profile photo, languages, dialects/regions, specialties, credentials, experience and availability.
- Verified interpreter profiles with concise user-facing language/dialect, specialty, verification, rating, experience and availability information.
- Simple interpreter discovery with language, dialect/region and specialty-based matching, useful filters and advanced filtering when needed.
- Automatic language detection/routing foundation to help identify the language and direct users toward appropriate available interpreters.
- Admin Dashboard for users/interpreters, credential verification and approval, profile/review moderation, organizations, account status, sessions/calls and basic platform activity.
- Central reusable backend/API for web, future mobile apps and commercial third-party API service.
- Core APIs for accounts, interpreter discovery, availability, session creation, call state and participant/session records.
- Accessible web UI patterns including keyboard navigation, screen-reader-friendly structure, accessible forms and call controls.
- DigitalOcean production backend, nginx, environment configuration and core security.

Milestone 2 - Real-Time Interpretation, Transcription, Stripe & Twilio

\$500

- Real-time browser audio/video calling using WebRTC and on-demand interpreter request/accept matching.
- Three-participant interpretation sessions, including new FiniSpeak calls and supported active-phone-call interpreter workflows.
- Microphone, camera, mute, call-state and end-session controls, plus a phone number dialer.
- Clear in-call interpreter information, call status/timer and live transcript access.
- Ability to flag an important moment during a session for easier follow-up.
- Live speech-to-text, speaker identification, timestamps and dual-language transcription/translation support.
- Authorized transcript storage and session history.
- Post-session details, authorized transcript/summary access, ratings/reviews, favorites and easy reconnection with trusted interpreters.
- Clear customer pricing before connecting, with pay-per-session/pay-per-minute support.
- Admin visibility for session activity, payment status, reviews and appropriate operational oversight.
- Twilio for SMS, notifications and telephony; Stripe for payments, receipts, refunds/webhooks, subscriptions/packages, interpreter/tutor earnings and platform-fee tracking.

Milestone 3 - Education, Business & FiniSpeak API Service

\$500

- Scheduling and availability for planned interpreter or tutor sessions.
- Education workflows including parent-teacher communication, language assistance for students and families, interpreter support during Individualized Education Program (IEP) meetings, enrollment/registration assistance and bilingual tutoring.
- Tutor/language-learning profiles, booking and live sessions.
- Business/organization accounts, roles, usage and reporting.
- Admin management for organizations, API customers, API usage and expanded reporting.

- Commercial FiniSpeak API with API keys/authentication, interpreter search/availability, interpreter requests, session/call management, webhooks and usage tracking.
- Foundation for usage-based API billing through Stripe and developer/API documentation.
- Traditional phone-call interpretation, premium multi-language rooms, enterprise SSO and white-label capabilities.

Milestone 4 - iOS, Android, Landing Website & Launch

\$500

- Native iOS and Android apps connected to the shared backend/API.
- Mobile interpreter discovery, verified profiles, matching, real-time calling, permissions, notifications, session history, favorites and transcript access.
- Mobile interpreter assistance for active phone conversations, subject to supported mobile/telephony capabilities.
- Apply the Milestone 1 accessibility approach to iOS and Android.
- Responsive public landing/marketing website with domain/DNS and HTTPS/SSL.
- Initial SEO, sitemap, robots.txt, structured data, Search Console readiness, analytics and initial GEO/AEO.
- Production permissions, Firestore rules, logging, backups, call recovery and transcript access/retention controls.
- End-to-end QA across web, admin, iOS and Android, including verification, calls, transcripts, payments, reviews, favorites and API workflows.
- Final requirements validation and launch preparation.

Services & Technology We Will Use

Firebase Authentication

Signup, login, account verification, password recovery and user identity.

Cloud Firestore

Users, interpreter profiles, languages, availability, organizations, sessions, transcripts, reviews, favorites, admin records and platform data.

DigitalOcean

Production backend/API hosting, deployment, nginx, environment configuration and server infrastructure.

WebRTC

Real-time browser and app audio/video communication.

Twilio

SMS, phone numbers, telephony, phone dialing and interpreter call workflows.

Stripe

Customer payments, usage billing, subscriptions/packages, refunds, earnings and platform-fee tracking.

OpenAI & Other AI Models

AI-assisted language processing, translation support, transcript processing, summaries, automatic language detection/routing, interpreter matching assistance and other intelligent features. The architecture can use multiple AI providers/models where appropriate.

Google Trust Services / HTTPS

SSL/TLS certificates and secure HTTPS connections where applicable.

Apple iOS & Google Android Services

Native mobile apps, device permissions, notifications and app-store deployment.
